Contents

VIRTUALBOX   **38**

W3M   **39**

WIRELESS SETUP   **39**

YAOURT   **39**

XRANDR: **40**

ANDROID:

ADB

$$a = \frac{2}{3}$$

na tem msestu bomo zapisali nekaj programov za android program na telefonu. glavno program je **adb** (**a**-ndroid **d**-e-**b**-ugger)… to omogoča, da priključimo telefon ns računalnik in se nanj povežemo tako, da delamo na terminalu…

= android deBugger… da se lahko z računalnikom povežeš na tel… in od tam urejaš linux (android)

BUSYBOX (nujno 4 me:)

splača se inštalirat ta program, ker omogoča razširjen nabor Linux ukaov kot so npr: cp, crond, vi (Editor) …

CROND

1. busybox
2. su
3. mount -o remount,rw /
4. mkdir bin
5. ln -s /system/bin/sh /bin/sh
6. crond -c /data/crontab

ARDUINO:

Enable PORT permmissions to user

```
1  sudo usermod -a -G dialout terrik
```

and Log Out / Log In

ARCH:

Programi

skripta…

AUTOSTART

BACKLIGHT

Včasih je težko krmiliti osvetlitev najlažje je, če dela xbacklight -set 10

če ne: osvetljenost je krmiljena v datoteki:

```
1        /sys/class/backlight/.../brightness
```

in v to datoteko zapišeš številko…

```
1        tee brightness <<<100
```

Moral sem spremeniti tudi dovoljenja, saj je po defaultu omogočeno le root-u. Zato v:

```
1    sudo vim /etc/udev/rules.d/basklight.rules
```

dodaš:

```
1  ACTION=="add", SUBSYSTEM=="backlight", KERNEL=="intel_backlight", RUN+=
     "/bin/chgrp video /sys/class/backlight/%k/brightness"
2  ACTION=="add", SUBSYSTEM=="backlight", KERNEL=="intel_backlight", RUN+=
     "/bin/chmod   g+w /sys/class/backlight/%k/brightness"
```

keyboard backlight (podobno kot za lcd backlight)

Dolphine

search ne dela… zato sem naložil še FSearch… naloži še Konsol)terminal

BLUETOOTH

> bluetoothctl scan trust pair

povezava

v terminau zaženeš:

> bluetoothctl bluetooth]# show Controller 74:E5:F9:19:10:2B (public) Name: archlabs Alias: arch-labs Class: 0x001e010c Powered: yes Discoverable: no Pairable: yes UUID: Headset AG (00001112-0000-1000-8000-00805f9b34fb) UUID: Generic Attribute Profile (00001801-0000-1000-8000-00805f9b34fb) UUID: A/V Remote Control (0000110e-0000-1000-8000-00805f9b34fb) UUID: OBEX File Transfer (00001106-0000-1000-8000-00805f9b34fb) UUID: Generic Access Profile (00001800-0000-1000-8000-00805f9b34fb) UUID: OBEX Object Push (00001105-0000-1000-8000-00805f9b34fb) UUID: PnP Information (00001200-0000-1000-8000-00805f9b34fb) UUID: A/V Remote Control Target (0000110c-0000-1000-8000-00805f9b34fb) UUID: IrMC Sync (00001104-0000-1000-8000-00805f9b34fb) UUID: Audio Source (0000110a-0000-1000-8000-00805f9b34fb) UUID: Audio Sink (0000110b-0000-1000-8000-00805f9b34fb) UUID: Vendor specific (00005005-0000-1000-8000-0002ee000001) UUID: NAP (00001116-0000-1000-8000-00805f9b34fb) UUID: Message Notification Se.. DD_IBS_TEST.SH():

test

program za testiranje dd komnade… kako hitro comp lahko kopira datoteke v odvisnosti ob bs= ? podatka… Program je na GitHubu

C++:

PassBy VALUE REFERENCE POINTER

Pomembno pri funkcijah, naprimer: void passByVal(int val); void passByRef(int &ref); void passByPtr(int *ptr);

Value

int x = 5;

naredi kopijo spremenljivke v stacku

[-] več spomina

[+] vrednost prvotne spremenljivke se ne spremeni

Reference

int &ref = x to je alias spremenljivke x [+] ne zasede novega spomina [+] če potrebuješ, da funkcija vrne več parametrov in NI potrebno imeti globalne spremenljivke. Vrednost spremenljivke se lahko spremeni med samo funkcijo

Pionter

int *xptr = &x; xptr je naslov spremenljivke x, če želimo vrednost na tem naslovu = xptr - nekoliko bolj zakomplicirana sintaksa, ker je prej potrebno v *xptr dati naslov spremenljivke + le s pointerji lahko dostopamo do **HEAP** spomina (spomin večjih razsežnosti)

CATFISH:

namestitev

Odličen iskalnik filov… po defaultu naložen.. hm ne vem od kdaj… v Thunar sem imel po defaultu
Commnad:

```
1   catfish --fileman=bl-file-manager --hidden --path=%f
```

:) aha … sem spremenil v :

```
1   catfish --path=%f
```

in dela :) glej gmone-search-tool

CHARACTER MAP:

pregled znakov

Super programček za brskanje znakov

```
1   gucharmap
```

Če uporabimo font "common" je tam veliko primernih znakov kot naprimer:

CONFIG FILES (my)

My all . dotfiles

```
1       find . -type f
```

./.zshrc ./.config/polybar/modules.conf ./.config/polybar/config ./.config/polybar/lounch_polybar.sh
./.config/polybar/master.conf ./.config/terminator/config ./.config/tint2/tint2rc ./.config/openbox/rc.xml

DOLPHINE FILE MANAGER

KDE-SERVICES

(ni blo dobr!!) For Arch Linux, edit /etc/pacman.conf and add the following (note that the order of repositories in pacman.conf is important, since pacman always downloads the first found package):

```
1  [home_metakcahura_Arch_Extra]
2  SigLevel = Never
3  Server = https://download.opensuse.org/repositories/home:/metakcahura/
      Arch_Extra/$arch
```

Then run the following as root

```
1  pacman -Syu
2  pacman -S home_metakcahura_Arch_Extra/kde-services
```

instalation

libkonq-frameworks-git iz link Dela !!! nato še run

```
1  kbuildsycoca5
```

datoteke pa so shranjene v: /usr/share/kservices5/ServiceMenus

ECLIPSE:

installation

… nisem zapisal… … presnameš, odpakiraš kopiraš v: /opt/eclipse/ narediš link za vse uporabnike: sudo ln -sf /opt/eclipse/cpp-neon/eclipse/eclipse /usr/bin/eclipse

eclipse.desktop:

Naredimo datoteko.desktop: sudo nano /usr/share/applications/eclipse.desktop

```
1  [Desktop Entry]
2  Version = Neon 2.0
3  Type = Application
4  Terminal = false
5  Name = eclipse
6  Exec = /usr/bin/eclipse
7  Icon = /opt/eclipse/cpp-neon/eclipse/icon.xpm
8  Categories = Development;
```

Arduino ECLIPSE Plugin

link **Instalation**

1. run eclipse c++ with "sudo"
2. Help–>eclipse marketplace
3. [x] Solber Arduino IDE
4. next –> "i agree" –> Finish…

EFI MODE:

test

boot -> CSM enable
security -> security boot control -> dissable

installBUNSEN

instaliral … grub dal na sda1 (kjer sem našel efi… [sudo parted -l]) kar nekaj sem probal… ni delalo - sedaj pišem kaj ne dela

BIOS: new boot oprions: /efi/boot/bootx64.efi ne dela

Test x-n probaj ta navodila: http://sarah.thesharps.us/2014/12/31/installing-debian-on-asus-ux301la/ — install grub -> /dev/sda1 takoj ne dela… zažene se win10… path :/EFI/debian/grubx64.efi [ne dela] path :/efi/boot/bootx64.efi [ne dela]

FZF:

link ## uporaba Fust FuzZy File Search … Res dober način zaiskanje filov… dve bljižnjici: - Ctrl+r => iskanje po zadnjih cmd-jih - Ctrl+t => iskanje po filih naprej po foldru - Tab => označi več filov..

FILEMANAGERs:

Thuar

Všeč mi je filemanager THUNAR:

```
1  sudo apt-get install thunar
```

Nemo

samba mi ni delala naložil sem še: - samba - pacman -S gvfs-smb

nato je delalo…

to je to !!! narejene so tudi skripte za …

shortcuts:

- • – expand all subfolders :)

FILES STRUCTURE

moja struktura

Mogoče da si narediš template za folders Tu bi napisal kako bom uredil file - Files + To-Do(links) + Work * PeF - Vaje + Modelarstvo + Promet - Habilitacija - Diplome - Članki - Predstavitve * DRTI - Poletne Šole - Finance - * + Hobi * Linux - BunsenLab - RPi * Dom * Kolesarjenje + Musics + GitHub ## Folder structure recimo za project ## Programs category 1. System 2. Development 3. Multimedia 4. Office 5. Graphics 6. Internet 7. Accesories 8. Other

FORMAT SD

ukazi

First, you have to find out which device (/dev/sd??) your USB stick is. Therefore look at the output of
>sudo fdisk -l

Jaz raje uporabim: >lsblk

```
1  NAME     MAJ:MIN RM    SIZE RO TYPE MOUNTPOINT
2  sda        8:0    0 465.8G  0 disk
3  +-sda1     8:1    0   300M  0 part /boot/efi
4  +-sda2     8:2    0   600M  0 part
5  +-sda3     8:3    0   128M  0 part
6  +-sda4     8:4    0 185.5G  0 part
7  +-sda5     8:5    0 271.3G  0 part /
8  +-sda6     8:6    0   7.9G  0 part [SWAP]
```

Lepo se vidijo diski in kje so mountirani. Po potrebi ga lahko od-mountiraš.. After that unmount the device/partition (if necessary) by running

```
1  sudo umount /dev/sdb
```

Make sure you replaced ?? with the correct device/partition name from the previous output. To format The partition as FAT32 use > sudo mkdosfs -F 32 -I /dev/sdb

FRITZING

FREECAD

asdf

GIMP

asdf # GITHUB ## LITERATURA: 1. Link

install:

Debian le

```
1  sudo apt-get install git
```

config:

```
1  git config --global user.name "davidrihtarsic"
2  git config --global user.email "david.rihtarsic@gmail.com"
3  git config --global core.editor="subl"
```

general_use:

make new repository … BlaBla_project (need to be on URL gitHub) make dir on your computer for that project navigate to that dir

```
1  git init
```

editing:

na tem mestu spreminjaš FAJL…

```
1  git add .
2  git commit -m "comment"
3  git commit -a -m "comment"
4  git status
5  git diff
```

uploading:

kako da stvar na GitHub… v spremenljivko "origin" spravimo URL projekta

```
1  git remote add origin https://github.com/davidrihtarsic/myZapiski.git
2  git push ~~origin master~~
```

updating:

naprimer, da nekdo popravi kodo (recimo ti sam na GitHubu… in nekdo tudi na compu ter naredi commit)

```
1  git commit -a -m "comment"
```

hočeš naložit… novo verzijo in dobiš konflikt s tisto na GitHub-u

```
1  git push origin master
2
3  hint: Updates were rejected because the remote contains work that you
      do
4  hint: not have locally. This is usually caused by another repository
      pushing
5  hint: to the same ref. You may want to first integrate the remote
      changes
6  hint: (e.g., 'git pull ...') before pushing again.
7  hint: See the 'Note about fast-forwards' in 'git push --help' for
      details.
```

potem naredis :

```
1  git pull
```

in če je bil dokument spremenjen na ISTEM mestu (recimo v isti crstici) potem je to v dokumentu oz-načeno z:

```
1      <<<<<<< HEAD
2          #to je novo na compu
3      =======
4          #to je novo na GitHubu
5          #heh nisem si zapisoval
6      >>>>>>> 14d185fbd48d55e9a37d7de3e4d9bde157aa8915
```

če pa je na različnih mestih pa dokument združi preko:

"recursive strategy"…

in je to - to :) skratka popraviš in uploadaš še enkrat :) jeah!

GRAPHIC CARD:

driverji

Kako preveriti in namestiti driverje za grafično kartico ## GeForce 9600 GT Jaz imam na PCju to kartico to lahko preveriš s: > "lspci"

V terminalu se ti izpiše nekaj takega:

```
1  05:00.0 VGA compatible controller: NVIDIA Corporation G94 [GeForce 9600
      GT] (rev a1)
```

Nato greš na tole stran: GeForce Drivers 1. vtipkaš podatke 2. Download 3. CTRL+ALT+F1 4. user: 5. password:

```
1  sudo service lightdm stop
```

HIBERNATION (arch)

Kako nastaviš da imaš hibernacijo računaljika… - potrebuješ dovolj swap particije - nasraviš resume - dodaš v grub pod HOOK tudi resume - zbildaš grub **ni delalo!!!!!!** nato je začelo delati… samo ne vem kdaj in kaj sem še naredil… večinoma sem se ukvarjal s pandocom… ampak to nima veze… link (to-do)

i3 WORKSPACE MANAGER

nastavitve

arch i3 navodila

moje bližnjice

1. *Mod* -> za okna/programe
2. +Left/Right -> focus left/right
3. +Shift+1/2/3 -> premakni program na workspace 1/2/3
4. *Mod+Control* -> za workspace
5. +Left/Right -> premakni WS na drug zaslon

6. +r -> RESTART WORKSPACE
7. +l -> reLoad i3 config
8. +v/h -> naslednji program naj se doda Vertikalno/Horizontalno
9. *Alt* -> za funkcije v programu
10. +Left/Right -> resize left/right
11. +1/2/3/4 -> tab focus
12. +F/E/H -> menu File/Edit/Help

ISO BURN TO USB

terminal cmd

```
1      sudo dd bs=4M if=*.iso of=/dev/sdb status=progress && sync
```

More advanced copy with progress

Inštaliran mora biti pv

```
1   sudo apt-get install pv
```

Ker pv (pipe Viever) dela več različnih stvari in ne le dd, med drugim tudi progress bar... je ukaz potrebno izvesti v sudo načinu:

```
1   sudo -s
2   pv <NekIsoFile.iso> /dev/sdb
3   857MiB 0:01:05 [13.1MiB/s] [==============================>] 100%
4   exit
```

JAVA in FIREFOX BROWSER

1. naložiš javo JRE...
2. mkdir ~/.mozilla/plugins
3. cd ~/.mozilla/plugins
4. ln -s /usr/lib/jvm/jre1.8.0_121/lib/amd64/libnpjp2.so [tu pride java direktorij kjer je libnpjp2.so]
5. restart FireFox
6. v FF vpišeš about:plugins in preveriš če je java podprta...

KEYBOARD SETTINFS:

Settings -> Reigon&Language -> Input Source for KeyBindings:

Settings for ARCH

```
1  sudo nano /etc/X11/xorg.conf.d/01.keyboard-layout.conf
2
3  Section "InputClass"
4      Identifier "system-keyboard"
5      MatchIsKeyboard "on"
6      Option "XkbLayout" "si"
7  EndSection
```

ShortCuts():

v settings>Keyboaard sem si nastavil nekaj bližnjic: > super+w > Firefox > super+e > Text Editor > super+f > File Manager > super+t > terminator

v ~/.bashrc (file se zazene na zacetku) > bliznica ll namesto ... > alias ll="ls -alF" > tipki [đ] dodelimo znak [/] > xmodmap -e "keycode 35 = slash"

LAZARUS

Programing program in pascal… As Delphi

instalation

instaliral tako kot je opisano na internetu: 1. Install fpc_3.0.2-170225_amd64.deb via package manager 2. Install fpc_3.0.2.x86_64-linux.tar via shell (unzip and run sh install.sh). Install into /usr directory, so it overwrites 3. the existing installation 4. Install the deb sources via package manager (**tega nisem naredu… neznam**) 5. Install lazarus-project_1.6.4-0_amd64.deb via package manager 6. Instaliral gdb

LIBREOFFICE:

Instal preko terminala:

```
1  apt-get install libreoffice
```

WRITER

Short Cuts

Short cut	Action
[Ctrl] + [Ent]	Insert Break Page
[]+[]	Insert greek letter

CALC

How To - Insert DATE:

1. Tools -> Customize -> Keyboard ->
2. Short Keys :Ctrl+.
3. Category: Insert

10. optimize your working environment

MARKDOWN

Uporaba:

> Takole s "\>" je označen tekst, ki je nokako označen kot *citat*. Lahko pa ga tudi citiramo[a]
>
> ---
> [a]In tu je tudi sprotna opomba. Potem nekaj navadnega texta…
>   z dvema TAB-oma je ločena vsaka vrstica kode. V Sublimu je pobarvana vijolično v pdf-ju pa je v okvirčku z ostevilčinimi vrsticami..

Če poznamo kodo jo lahko poumenujemo: Naprimer: c++ in Python

```
1  int test = 0;
2  void loop(){
3    digitalWrite(led_pin, HIGH);
4  }
```

in Python

```
1  s = "Python syntax highlighting"
2  print s
```

1. nastevanje
2. nastevanje..

- nast
- nast
- nato pa se

- nato tudi to
    - lahko pa tudi
    - ali a

podčtrano

~~prečrtano~~ bom uporabljal tam kjer sem nekaj probal pa ni delovalo

link

Live preview

Instalation

```
1  pacman -S npm
2  sudo npm install -g markmon
```

SublimeText3 -> Package Controll -> Install Package : Markmon

run

Ctrl+Shift+p –> Markmon launch

LaTex Commnads

Deluje tudi če napišemo naslednje LaTex ukaze:

```
1  \tableofcontent
2  \newpage
```

Enačbe

Enačbe lahko pišemo zelo enostavno, tako da celotno enačbo zaviješ v dva dolarja.

$$y = mx + b$$

$$\int_a^b x^2 dx$$

$$y(x) = 2x_a^2 + 1$$

$$\frac{\frac{1}{x} + \frac{1}{y}}{y - z}$$

Več o tem kako se pišejo enačbe lahko preberemo na tej strani: https://en.wikibooks.org/wiki/LaTeX/Mathematics.

References (citiranje)

V metadata poleg title, author vpšemo tudi **bibliography:** in dodamo še ime datoteke z BibTex datoteko referenc… in nato tu citiramo v besedilu naprimer Rihtaršič, Avsec, and Kocijancic (2015).

Da tako oblikovano md datoteko spravimo v pdf pa vpšemo naslednji ukaz:

```
pandoc -o test.pdf --from markdown --template eisvogel --listings --pdf
    -engine=xelatex myLinuxNotes.md --filter pandoc-citeproc
```

in to je to.

Možnosti citiranja

Poskusimo še tri načine citiranja. Če želimo citirati tako kot to počnemo običajno na koncu neke smiselne povedi to naredimo tako da v oglate oklepaje napišemo ime reference. Naprimer citat se izpiše takole**(Rihtaršič, Avsec, and Kocijancic 2015)** v besedilo pa ga vnesemo takole:

```
[@Rihti2015]
```

Če pa želimo citirati tako, da se v besedilu navezujemo na avtorje, naprimer da nekateri avtorji kot **Rihtaršič, Avsec, and Kocijancic (2015)** svetujejo to in ono… pa naredimo le takole:

```
@Rihti2015
```

Poleg teh dveh citiranj lahko citiramo tudi brez priimkov avtorjev naprimer tam, kjer jih moramo sklanjati ali kako drugače opredeliti, da so prav ti omenjeni avtorji sodelovali dlje časa z Rihtaršičem **(2015)**. To pa naredimo takole:

```
-@Rihti2015
```

DOI to BibTex

Ko iščemo vire imamo pogosto možnost oznake DOI (angl.: **D**igital **O**bject **I**dentyfier). Če želimo iz te oznake še ostale podatke o viru jih lahko dobimo preko te strani: https://www.doi2bib.org/. Tako

podatke lahko shranimo v orimerno oblikovano besedilo, da ga lahko uporabimo v zgornji funkcional-
nosti.

```
 1  @article{Rihti2015,
 2    doi = {10.1007/s10798-015-9310-7},
 3    url = {https://doi.org/10.1007/s10798-015-9310-7},
 4    year  = {2015},
 5    month = {may},
 6    publisher = {Springer Nature},
 7    volume = {26},
 8    number = {2},
 9    pages = {205--224},
10    author = {David Rihtar{\v{s}}i{\v{c}} and Stanislav Avsec and Slavko
        Kocijancic},
11    title = {Experiential learning of electronics subject matter in
        middle school robotics courses},
12    journal = {International Journal of Technology and Design Education}
13  }
```

MERGE PDF DOCUMENTS

Če moramo združiti več pdf dokumentov v enega v terminal napišemo: > pdfunite pdf0.pdf pdf1.pdf
merged.pdf

MUSIC TAGGING (audi tags)

V terminalu lahko uporabljalmo: *beets*:

```
 1  beet import ~/Music/BigFoodMama/
```

in nato beet poišče v bazah iz spleta kateri album, izvajalec naslov pesmi…

NEMO

File browser

Script

You can add yours scripts… Script must be added to:

```
1  ~/.local/share/nemo/actions
```

Script example:

Shortcuts

Key combo	Action
A+Home	go to HOME dir

PACMAN

Program za pakete = PACkage MANager. Ena varianta je, da uporabiš: PACLI programček v terminalu…

pacman -S paket

> namesti paket

ERRORS

failed to… > odstraniš paket, ki ti ga javi in probaš še enkrat…

PASSWORD (LINUX)

To change a password on behalf of a user, first sign on or "su" to the "root" account. Then type: (where user is the username for the password you are changing). > passwd user

The system will prompt you to enter a password. Passwords do not echo to the screen when you enter them. You can also change your own password, by typing: (without specifying a username). > passwd

You will be prompted to enter your old password for verification, and then a new password. # PDF MERGE/SPLIT pdfunite source1.pdf source2.pdf out.pdf

PIDGIN

HANGOUTS

https://bitbucket.org/EionRobb/purple-hangouts/ > sudo apt-get install -y libpurple-dev libjson-glib-dev libglib2.0-dev libprotobuf-c-dev protobuf-c-compiler mercurial make; > hg clone https://bitbucket.org/EionRobb/purple-hangouts/ && cd purple-hangouts; > make && sudo make install

Po tem greš na tole spletno stran: https://accounts.google.com/ServiceLogin?passive=1&continue=https://accounts.g m3jnlsqshjhh5lbvg05k46q1k4qqtrgn.apps.googleusercontent.com%26top_level_cookie%3D1%26from_login%3D1%

ko sem naredil tole, je delal tudi skype plugin…

Skype

https://github.com/EionRobb/skype4pidgin > cd skype… > make > sudo make install

GoogleTalks

My account -> Prijava in varnost -> Gesla za aplikacije -> ime aplikacije : PIDGIN [ustvari] -> qwer tzui opšd asdf — basic — Protocol:XMPP user:david.rihtarsic domain:gmail.com Resource:Home pass: qwer tzui opšd asdf [x] remember pass [x] new mail… — advanced — Connect server: talk.google.com ## WhatsApp debhelper (>= 7.0.50), libglib2.0-dev, libpurple-dev, libfreeimage-dev (>= 3.0.0), libprotobuf-dev, protobuf-compiler make ARCH=x86_64

sudo apt-get install protobuf-compiler get :https://github.com/davidgfnet/whatsapp-purple/ cd -> whatsapp-purple make

POPCORN-TIME

POWERTOP

Program za zmanjševanje porabe el. energije laptopa…

Running

```
1  sudo powertop --auto-tune
```

To-do

da se program sam zažene…

PRELOAD (deamon service)

preload is a program written by Behdad Esfahbod which runs as a daemon and records statistics about usage of programs using Markov chains; files of more frequently-used programs are, during a computer's spare time, loaded into memory. This results in faster startup times as less data needs to be fetched from disk.

Running

```
1  __systemctl start preload.service__
2  systemctl enable preload.service
```

Config

```
1  /etc/preload.conf
```

To-do

da se sam zažene ob zagonu

PPRINTER SUPPORT on BunsenLab

sledil sem tocno tem navodilom - prej moraš vedeti tudi root geslo

Program za gledanje filmov: 1. Download Popcorn-Time 2. razpakiraš in daš dokumente v /opt/popcorn-time/ 3. polinkaš, da bo dosegljivo vsem: sudo ln -sf /opt/popcorn-time/Popcorn-Time /usr/bin/popcorn-time 4. Narediš še .desktop datoteko sudo nano /usr/share/applications/popcorn-time.desktop 5. in vot vpišeš:

```
1  [Desktop Entry]
2  Version = 1.0
3  Type = Application
4  Terminal = false
5  Name = Popcorn Time
6  Exec = /usr/bin/popcorn-time
7  Icon = /opt/popcorn-time/src/app/images/icon.png
8  Categories = Application;
```

PRINT SCREEN = DARK

QCAD

1. presnameš inštalacijo iz njihove [strani][https://qcad.org/en/qcad-downloads-trial]
2. nato spremeniš rivilegije datoteke: > sudo chmod 777 qcad*.run
3. in poženeš script: > ./qcad*.run

Qt5

Za nekateri program sem si moral nainštalirat Qt5 knjižnice: 1. Manjkala mi je Qt5LinguistToolsConfig Ostale mislim, da sem imel…

Instalacija Qt5LinguistToolsConfig

Mislim, da mi jo je uspelo naložit z: > sudo apt-get install qttools5-dev

nato sem datoteko našel: > sudo find /usr/lib/* -name Qt5Lin*

nato je manjkal še Qt5Quck instaliral sem ga z > sudo apt-get install qtdeclarative5-dev

nato je manjkal Qt5SvgConfig, instaliral z: > sudo apt-get install libqt5svg5-dev > sudo apt-get install libraw-dev –sudo apt-get install exiv2 (najverjetneje ni bil taprav paket!!!)– > sudo apt-get install libexiv2-dev > sudo apt-get install graphicsmagick

še vedno ni delalo nato sem inštaliral qt5 creator… (neumnost, ker je to cel program za programiranje) > sudo apt-get install qtcreator

še ni pomagalo: sudo apt-get install qml-module-qtgraphicaleffects sudo apt-get install qml-module-qtquick-dialogs sudo apt-get install pyqt5-dev sudo apt-get install qtdeclarative5-models-plugin

SCAN

simple scan

v terminalu pa lahko : inštaliraš SANE

SOUNDON:

Na začetku mi ni delal zvok… Rešitev je bila: 1. lspci: tako preveriš, če je Linux prepoznal zvočno… na terminalu sem dobil:

```
1    '00:1b.0 Audio device: Intel Corporation 7 Series/C210 Series Chipset
        Family High #inition Audio Controller (rev 04)'
```

2. apt-get install libasound2 alsa-utils alsa-oss
3. alsamixer: in od "mutiraš" kanale, ki so zamutani Druga rešitev (ali celo dopolnitev):

- je, da v terminal napišeš: pulseaudio -D
- secer napiše, da ni mišljeno, da bi bil zagnan kot root ampak Ok… po tem dela tudi: Settings>Soun

SUBLIME TEXT 3

Install:

Greš na njihovo stran in snameš dol pravo verzijo (Ubuntu 64) nato pa v terminalu zaženeš:

```
1  cd Downloads
2  dpkg -i Sublime...64.deb
```

Nastavitve - Key Bindings

Da imam kompatibilnost z ostalimi programi si nastavim še KeyBindings veliko command najdemo tule:link

1. -> Preferences -> KeyBindings
2. v "User" pastneš tole:

```
 1  [
 2
 3    { "keys": ["ctrl+e"],      "command": "toggle_side_bar" },
 4    { "keys": ["ctrl+t"],      "command": "new_file" },
 5    { "keys": ["ctrl+shift+c"], "command": "git_quick_commit" },
 6    { "keys": ["ctrl+shift+u"], "command": "git_push_current_branch" },
 7    { "keys": ["ctrl+shift+d"], "command": "git_pull_current_branch" },
 8    { "keys": ["ctrl+alt+s"],   "command": "pandown_build",
 9                  "args":{
10                    "pandoc_from": "markdown",
11                    "pandoc_to": ["latex", ".pdf"],
12                    "prevent_viewing": true
13                  }
14    },
15    { "keys": ["ctrl+alt+i"], "command": "insert",
16                  "args": {
17                    "characters": "![caption\\label{slika}](link)"
18                  }
19    },
20    { "keys": ["ctrl+alt+e"],   "command": "insert",
21                  "args": {
22                    "characters": "$$Y=kX+n$$ {#eq:linearna-f}"
23                  }
24    },
25    { "keys": ["f10"],  "command": "citer_show_keys"},
26    { "keys": ["ctrl+alt+t"],   "command": "shell_command",
27                  "args": {
28                    "command": "~/Files/GitHub_noSync/ArchLabs/
29                        MyDotFiles/timesheetNotes.sh",
29                    "target": "point"
30                  }
31    },
32    { "keys": ["ctrl+alt+d"], "command": "shell_command",
33                  "args": {
34                    "command": "date +'%F'",
35                    "target": "point"
36                  }
37      },
38      { "keys": ["ctrl+alt+h"], "command": "shell_command",
39                  "args": {
40                    "command": "date +'%R'",
41                    "target": "point"
```

```
42                              }
43          },
44      { "keys": ["ctrl+alt+m"],      "command": "insert",
45                  "args": {
46                      "characters": "---\ntitle: 'Naslov'\nauthor: [dr.
                            David ščRihtari]\ndate: \ntags: [tag1,tag2]\
                            nbibliography: bibtex.bib\n---"
47                  }
48      },
49      { "keys": ["ctrl+enter"], "command": "shell_command",
50                  "args": {
51                      //"prompt": "Enter a command",
52                      "title": "My Command",
53                      "target": "point"
54                  }
55      }
56  ]
```

Package Controll:

Paket za koristne funkcionalnosti:

install Package Controll: 1. goto [link][https://packagecontrol.io/installation] 2. *copy* code for Sublime 3: import urllib.request,os,hashlib; h = "df21e130d211cfc94d9b0905775a7c0f" + "1e3d39e33b79698005270310898eea76"; pf = "Package Control.sublime-package"; ipp = sublime.installed_packages_path(); urllib.request.install_opener(urllib.request.build_opener(urllib.request.ProxyHandler())); by = urllib.request.urlopen("http://packagecontrol.io/" + pf.replace(' ',"%20')).read(); dh = hashlib.sha256(by).hexdigest(); print("Error validating download (got %s instead of %s), please try manual install" % (dh, h)) if dh != h else open(os.path.join(ipp, pf), "wb").write(by) 3. View -> Show Console 4. *paste*

GitGutter

kaže kaj si na novo naredil v primerjavi s fajlom na GitHubu

Git

1. C+S+p -> Install Packages
2. [Git()][https://github.com/kemayo/sublime-text-git/wiki]

automatic uploading in Sublime

v .git/config zamenjaš namesto:

```
1  [remote "origin"]
2  url = https://github.com/davidrihtarsic/BunsenLab.git
3  fetch = +refs/heads/*:refs/remotes/origin/*
```

v

```
1  [remote "origin"]
2  url = https://davidrihtarsic:rihtarsicda888@github.com/davidrihtarsic/
       BunsenLab.git
3  fetch = +refs/heads/*:refs/remotes/origin/*
```

nastavitve

The detail step

1. go to your local git project directory, [open][.git/config] file and

2. edit: https://{username}:{password}(**???**)/{username}/{project}.git
3. input git push to check if it works.

jaz sem moral prej še spedenat v terminalu

```
1  git commit -a -m "sublime pedenanje"
2  git push č(e je kak error prej še git pull... in špopravi razlike)
```

uporaba:

1. popraviš file… & C+s (save)
2. C+S+p -> quick commit (repo) -> msg
3. C+S+p -> push

MarkDown

Paket Package Controll mora biti nameščen… 2. Install Package: *Monokai extended* 3. Preferences ->
Color Scheme -> Monokail Extended -> Monokail Extended 4. Install Package: *Markdown Editing* 5. Set
doc. syntax = Monokai Extended 6. Preferences -> Package settings -> Markdown Editing -> Markdown
Settings (standard) - User:

```
1  {
2    "color_scheme": "Packages/Monokai Extended/Monokai Extended.tmTheme"
       ,
3    "tab_size": 2,
4    "line_numbers": true,

Pandown (SublimeText3 Plugin)

V Preferences -> Package settings –> Pandown –> Settings -user:

```
1  {
2    "pandoc_arguments":
3    {
4      "command_arguments":
5      {
6        "template": "eisvogel",
7        "variables":
8        {
9          "lang":"sl"
10       },
```

```
11        "filter":
12            [
13                "pandoc-eqnos",
14                "pandoc-crossref"
15            ],
16        "listings": true,
17        "incremental": false,
18        "latex-engine": "",
19        "bibliography":
20        [
21          "bibtex.bib",
22          "/home/david/Files/Work/PeF/Articles/bibtex_global.bib"
23        ]
24      }
25    }
26 }
```

LaTeX:

namestis paket preko: C+S+p -> **Install Packages** ~~LaTeXTools~~ OK, prej moras namestiti dodatne pakete..:

```
1 sudo apt-ge" : "t install texlive-full
2 sudo apt-get install latexmk
3 sudo apt-get install biber
```

LaTex:

Našel sem, da lahko iz MarkDown datoteke naredis pdf tako, da uporabim *pandoc*. S tem programom lahko spremeniš tudi v druge formate WORD… Ampak moraš inštalirat še LaTeX podporo…

```
1 texlive-full
```

program zasede full okoli 2GB zato inštaliraš raje

```
1 texlive
```

PanDoc

Install (ARCH=x86_64):

```
1  yaourt pandoc 2.0.6.11
```

nato pa še packages:

```
1  sudo apt-get install texlive-latex-extra
2  __sudo apt-get install texlive-fimts-extra__
```

oba paketa sem inštaliral preko SynapticPackageManager, ker je preveč dependenciesov… **CMD:**

```
1  pandoc -o test.pdf --from markdown --template eisvogel --listings
       myLinuxNotes.md
```

TEMPLATE GENERATOR_ da naredič template v terminal vpišeš:

```
1  pandoc -D latex
```

(objavil je Luck Schmit)

Spell Checker:

download: v direktorij: /home/david/.config/sublime-text-3/Packages/

```
1  wget https://github.com/titoBouzout/Dictionaries/archive/master.zip
2  //then unz
3  unzip..
```

ali … 1. Download the language file from the appropiate OpenOffice extension 2. Rename the "some.oxt" file to "some.zip" 3. Unzip the file 4. Look for two files: "lang.aff" and "lang.dic". For example es_ES.aff and ES.dic 5. Open the "lang.aff" to check the encoding used. Such the line: SET -8859-1 6. Convert that file to UTF-8 from the used encoding 7. Convert "lang.dic" to UTF-8 from the used encoding. 8. Change SET ISO-8859-1 to SET UTF-8 9. In ST3, click on Preferences -> Browse Packages 10. Create a new folder, for example Language - Spanish 11. Move lang.dic and lang.aff to that folder 12. Activate the dictionary in ST3 (View -> Dictionary -> Language - Spanish es_ES) 13. Press F6 to enable spell check 14. View->Dictionaries

Google spell check: + apt-get update + dpkg -i teamviewer_****_i386.deb + sudo apt-get -f install namestitev: C+S+p -> Install Packages Google Spell Check

SYSTEMD

Program skrbi za zagon UNIT-ov ali procesov oz. v linuxu se jim reče *deamon*.

uporaba

```
1  systemctl enable UNIT.service --> zagon servisa tudi ob restartu
2  systemctl start UNIT.service --> zagon servisa za ta sesion
3  systemctl stop UNIT.service --> izkljuci servis
4  systemctl restart UNIT.service --> ponovni zagon servisa za ta sesion
5
6  systemctl status -l UNIT.service --> nekaj čve podatkov o UNITU
```

log file

če je kak eror na začetku ga lahko pogledaš z:

```
1  journalctl -b
2  journalctl -f - za sprotno gledanje kaj gre narobe...
```

system run

```
1  systemctl
2    - hibernate
3    - suspend
```

TERMINAL:

Terminal je najboljši terminator > sudo apt-get install terminator

Preferences:

[ ] Show title bar Profiles -> Colors = Green on Black Profiles -> Background -> Transparency = 50%

Programi za terminal

SC-IM

excel za terminal… super omogoče veliko excelovih stvari … tudi izvoz v .xlsx **Uporabne komande:** >
4 // skočimo za 4 celice dol - uporabno pri kopiranju če se moraš premaknit > yr // copy (YUNK) celo
ROW > p // paste cel YUNK > +/- // increse/decrese number > C-d // transform to DATE > f // 0.00 ->
0.000 > f // 0.00 -> 0.0 > f // spremeni širino stolpca

V /home/david/.scimrc napišemo: > nmap "W" ":w:e! txt:e! xlsx" //mapira "W" tako da shrani datoteko
v .sc, .txt in .xlsx

TAB_CLICK:

Da vklnjučiš Tab-CLICK greš v: 1. settings 2. mouse 3. in nato : Tab-CLICK = ON Videl sem tudi, da
problem reši tudi: > synclient tapbutton1 = 1

Touchpad

v [datoteki][/usr/share/X11/xorg.conf.d/50-synaptics.conf] dodas:

```
 1  Section "InputClass"
 2    Identifier     "Touchpad"                 # required
 3    MatchIsTouchpad "yes"                      # required
 4    Driver         "synaptics"                 # required
 5    Option         "MinSpeed"         "0.5"
 6    Option         "MaxSpeed"         "1.0"
 7    Option         "AccelFactor"      "0.075"
 8    Option         "TapButton1"       "1"
 9    Option         "TapButton2"       "3"      # multitouch
10    Option         "TapButton3"       "2"      # multitouch
11    Option         "VertTwoFingerScroll"  "1"  # multitouch
12    Option         "HorizTwoFingerScroll" "1"  # multitouch
13    Option         "VertEdgeScroll"   "1"
14    Option         "CoastingSpeed"    "8"
15    Option         "CornerCoasting"   "1"
16    Option         "CircularScrolling" "1"
17    Option         "CircScrollTrigger" "7"
18    Option         "EdgeMotionUseAlways" "1"
```

```
19    Option            ”LBCornerButton”        ”8”      # browser ”back” btn
20    Option            ”RBCornerButton”        ”9”      # browser ”forward”
      btn
21 EndSection
```

TEAMVIEWER

presnames teamviewer i386 (cetudi imas 64-bitni comp.) v terminalu> + sudo dpkg –add-architecture i386 + sudo apt-get update + sudo dpkg -i teamviewer_****_i386.deb + sudo apt-get -f install

TEXMAKER

1. Spell   Checker: [download][http://extensions.services.openoffice.org/en/project/slovenian-dictionary-package-slovenski-paket-slovarjev]
2. unzip pac-sl.oxt
3. in prekopiraš datoteko sl-SI.dic v Sublime paketi direktorij (Preferences->Browse packages)
4. nato nastaviš jezik : View->Dictionary->si-SL.dic

THUNDERBIRD()

inštalacija je čisto reprosta: > apt-get install thunderbird

ali če ni apt paketa: 1. greš na njihovo stran in presnameš datoteko thunderbird.tar.db2 2. extrahiraš v /opt/thunderbird 3. preveriš če dela: ./thunderbird 4. nastaviš privilegije (če je potrebno):

> sudo chown -R root:root /opt/hunderbird

5. in linkaš exe skript:

> sudo ln -fs /opt/thunderbird/thunderbird /usr/bin/hunderbird

Nastavitev Thunderbirda za PeF

- Your name: David Rihtarsic
- Email add: david.rihtarsic@pef.uni-lj.si

Paragraph space

Da ne pušča preveč prostora med posameznimi odstavki, je potrebno nastaviti: - Menu [=] -> Preferences -> Composition : + [ ] Use Paragraph format instead of Body Text by default.

TO-DO

[ ] Make .config files –> backup to Git->MyDotFiles + skript v ~/.config/i3 + keybinding v i3/config + ali pa naredis linke za vse file, ki so v GitHub_noSyncGit/MyDotFiles/.config * beckup obstojecih in * linke filov * nato pa editiras samo te, ki so v GitHub_noSync… [ ] /i3/config + dodaj, da se da osvetljenost

ekrana na full, če comp na elektiki [ ] preveri v installMyArchApps za vsako od postavk, če je inštalirana
+ v funkciji .installPacman in .installYaourt

VIM

Instalation

```
1   sudo apt-get install vim-nox
```

install Vundle - Plugin Manger

Run v terminalu:

```
1   git clone https://github.com/VundleVim/Vundle.vim.git ~/.vim/bundle/
        Vundle.vim
```

V ~/.vimrc na vrhu vpiš:

```
1    set nocompatible
2    filetype off
3        set rtp+=~/.vim/bundle/Vundle.vim
4        call vundle#begin()
5
6    Plugin 'VundleVim/Vundle.vim'
7        Plugin 'majutsushi/tagbar'
8        ” za delovanje šmora šintalirati še:
9        ” exuberant-stags
10
11       call vundle#end()            ” required
12       filetype plugin indent on    ” required
```

Instalation Plugins from terminal

```
1        yaourt -S vim-tagbar
```

Instalation of FZF

Super stvar : fuzzy file search!

1. Najprej pustiš, da vim nainštelira plugin: junegunn/fzf

2. Nato poženeš:

    ~/.vim/bundle/fzf/install

3. in ponovno zaženeš terminal in vim.

Plugin uporabljaš tako, da : - Ctrl+T => za iskanje filov - Ctrl+R => za iskanje kommand v terminalu..

Če želimo, da lahko iščemo še po skritih dokumentih moramo v .zshrc vpisati:

```
1  export FZF_DEFAULT_COMMAND="find . -type f -print -o -type l -print"
2  export FZF_CTRL_T_COMMAND="find . -type f -print -o -type l -print"
```

VIRTUALBOX

```
1  pacman -S virtualbox
2  pacman -S pacman -S virtualbox-host-dkms
3  sudo modprobe vboxdrv
```

W3M

instalation:

```
1  apt-get install w3m
```

frendlyUse:

v ~/bashrc vpišeš: > alias w3mm="w3m www.google.com"

WIRELESS SETUP

Wavemon… > sudo apt-get install wavemon

YAOURT

To je program za ARCH za namestitev paketov… ni da ni! - če vemo natančno ime lahko samo yaourt -S –noconfirm # XANMOD KERNEL: XanMod is a mainline Linux kernel distribution with custom settings. Optimized to take full advantage of high-performance Desktops, PC Gamers, Workstations, Media Centers and others. Supports all recent 64-bit versions of Debian and Ubuntu-based systems.

- ne priporočam, ker potemnisem mogel inštalirati GeForce driverjev…

Tested

based on article tested on Ubuntu MATE (DELA SUPER!): * Firefox prej 10.5 s … po tem 4.6 s * kopiranje dd (komanda) prej 9MB/s le pri bs=128K * po tem… 9MB/s pri 1K, 4K, 8K, 32K,

Installation

1. https://xanmod.org/
2. First install the XanMod Repository Setup
3. manual… > echo "deb http://deb.xanmod.org releases main" | sudo tee /etc/apt/ urces.list.d/xanmod-kernel.list && wget -qO - http://deb.xanmod.org/gpg.key sudo apt-key add -
   > sudo apt update && sudo apt install linux-xanmod-4.9

> sudo reboot

> cat /proc/version (preveri kernel verzijo:)

4. chane [cfg] disk scheduler:

5. preveri: > sudo cat /sys/block/sda/queue/scheduler (kateri so na razpolago)

    > sudo subl /etc/#ault/grub (edit grub settings)

6. spremeni vrstico: > GRUB_CMDLINE_LINUX_#AULT="quiet splash"

    > GRUB_CMDLINE_LINUX_#AULT="quiet splash elevator=bfq"

7. shrani

8. sudo update-grub2

9. reboot

10. preveri disk scheduler: > sudo cat /!!sys/block/sda/queue/scheduler

11. install Intel CPU support:

12. ker sem prej dobil error: W: Possible missing firmware /lib/firmware/rtl_nic/rtl8107e-2.fw for dule r8169 sem namestil še firmware, a mislim, da ni šlo skoz… > sudo apt install intel-microcode iucode-tool > sudo reboot

XRANDR:

te nastavitve so odvisne od monitorja… ! najprej:

```
1  cvt 1280 1024 60
2
3  # 1280x1024 59.89 Hz (CVT 1.31M4) hsync: 63.67 kHz; pclk: 109.00 MHz
      Modeline "1280x1024_60.00" 109.00 1280 1368 1496 1712 1024 1027 1034
       1063 -hsync +vsync
```

…kopiras kar ti terminal vrže…:

```
1  sudo xrandr --newmode "1280x1024" 109.00 1280 1368 1496 1712 1024 1027
      1034 1063 -hsync +vsync
```

dodas v moznosti:

```
1  sudo xrandr --addmode VGA1 1280x1024
```

potem nastavis resolucijo v MENU -> Settings -> Arandr ali v terminalu:

```
1  xrandr --output VGA1 --mode 1280x1024 --pos 1366x0
```
